WEEKLY HEALTH REPORT

NATURE OF THE DATA

The data presented here are taken from the Statistical Reports, Forms 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

MORBIDITY DATA

Admissions are reported only for cases hospitalized or confined to quarters and excused from duty for 24 hours or more, except for certain cases carded for record only (chiefly venereal disease cases which are treated on a duty status, and deaths which occurred before being "admitted" to hospital or quarters). Admissions designated as "injury" comprise all traumatisms (i.e. morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, and reactions to medications). All other cases are classified as "disease", bearing in mind that under present conditions there would not be any direct admissions in the continental U.S. properly classifiable as battle casualties.

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per thousand strength as given in this report furnishes an approximation to the current non-effective rate. The mean number of non-effectives per thousand strength is given in the summary table for the total United States and for each of the Service Commands.

MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated. Readers are cautioned not to use the deaths from injury or the deaths from all causes shown in these reports as accurate indications of mortality.

STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having a

strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table.

HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), total beds occupied and beds "available vacant".

Unless otherwise specified, normal bed capacity in this report is defined in Par 36b (1) and (2) of AR 40-1080, 10 December 1943 and Par 14 WD Circular 43, 1 February 1944. This includes the T/O capacity of non-fixed hospitals but excludes convalescent facilities. Total beds include expansion beds in addition to normal beds. Beds in dispensaries, convalescent facilities, venereal disease facilities, and college or university training units are not included in the tabulations for individual stations.

The number of beds "available vacant" is defined as 80% of the total capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied.

In the case of general hospitals there are shown, in addition, the number of Army patients admitted and disposed of during the week (by death, return to duty, transfer, or otherwise), the number of such patients remaining in hospital (including convalescent facilities, if any) at the end of the week, and corresponding data for battle casualties. The bed capacity and beds occupied in convalescent facilities are also indicated. The patients "otherwise" disposed of represent for the most part discharges on account of disability. In the case of Army battle casualties, all of which are currently admitted to general hospitals in this country as transfers, there is shown for each hospital the net number transferred during the week; i.e., admissions by transfer less dispositions by transfer. The total for the country as a whole represents the number of battle casualties evacuated to the United States from overseas theaters.

EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station has not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

VARIATIONS BY SERVICE COMMAND
CONTINENTAL UNITED STATES

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 24 MARCH 1944

COMMENT ON CURRENT TRENDS

CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

All Causes: Disease and Injury:

As indicated in the chart on page 3, the admission rates from all causes and from disease both decreased about 4 percent, reflecting chiefly a corresponding decline in morbidity from respiratory causes. The general downward trend in morbidity from all causes and from disease thus again became manifest, with admission rates continuing well below those for the corresponding period in 1943. For the week ending 24 March 1944 the admission rate from all causes was reported at 692 per year per thousand, while the admission rate from disease was reported at 622 per year both being about 30 percent below the corresponding rates for the week ending 26 March 1943. The admission rate from injury continued on the low level, which has prevailed in recent months.

Respiratory Causes:

The admission rate from colds, influenza, etc. continued downward and for the week ending 24 March 1944 was reported at 197 per year per thousand or about 10 percent lower than for the preceding week. Since about the middle of January until early March 1944, morbidity from these causes has been about 35 percent below that recorded for the corresponding period of 1943, and for the last two weeks reported on, this difference widened to 40 percent. The admission rate from all forms of pneumonia declined to 15 per thousand, which is about 10 percent under the preceding week's rate and about 40 percent under the rate for the corresponding week of 1943.

Common Communicable Diseases:

New cases of mumps increased sharply to the highest figure reported for any week in 1944. New cases of measles and scarlet fever both declined. The number of cases of meningitis increased slightly as did the number of cases of rheumatic fever, the latter reaching the highest weekly total reported during the last six months.

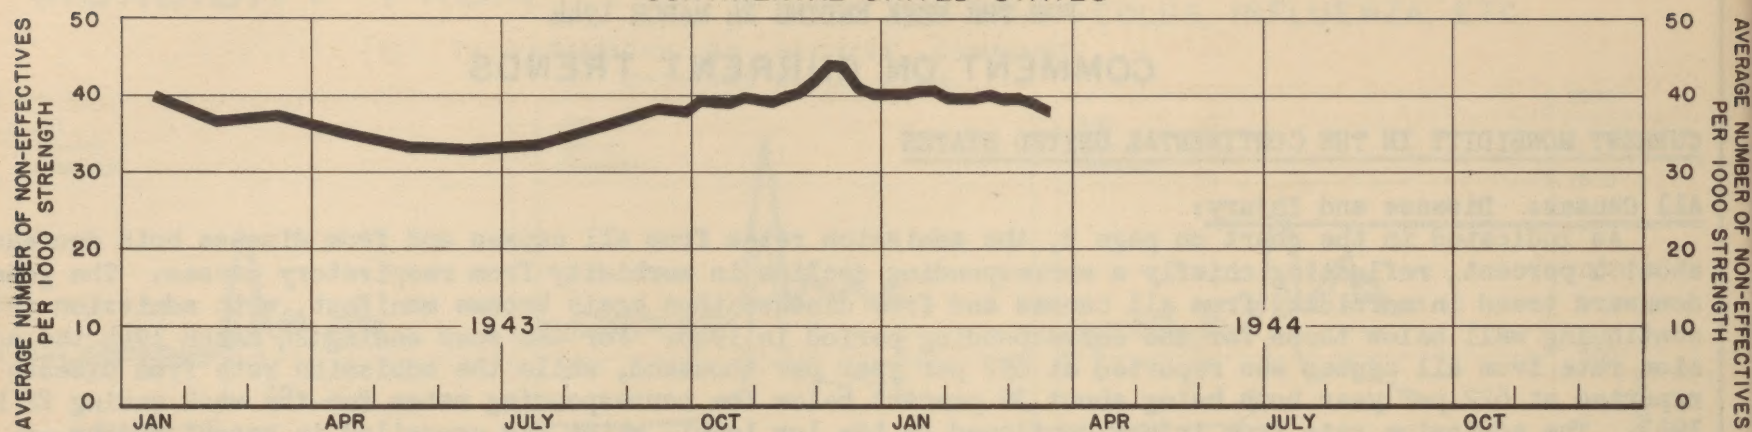

VARIATIONS IN MORBIDITY BY SERVICE COMMAND:

All Causes: Disease and Injury:

Substantial declines in admission rates from all causes and from disease were registered in the First and Second Service Commands. The Sixth, Seventh, and Ninth Service Commands reported moderate decreases in admission rates and only the Third and Fifth Service Commands experienced slightly higher morbidity. In the Second Service Command the sharp decreases in the admission rates from all causes and from disease reflected a corresponding decrease in morbidity from colds, influenza, etc. In the First Service Command lower admission rates from respiratory causes were only partly responsible for the decline in morbidity. As in preceding weeks, the

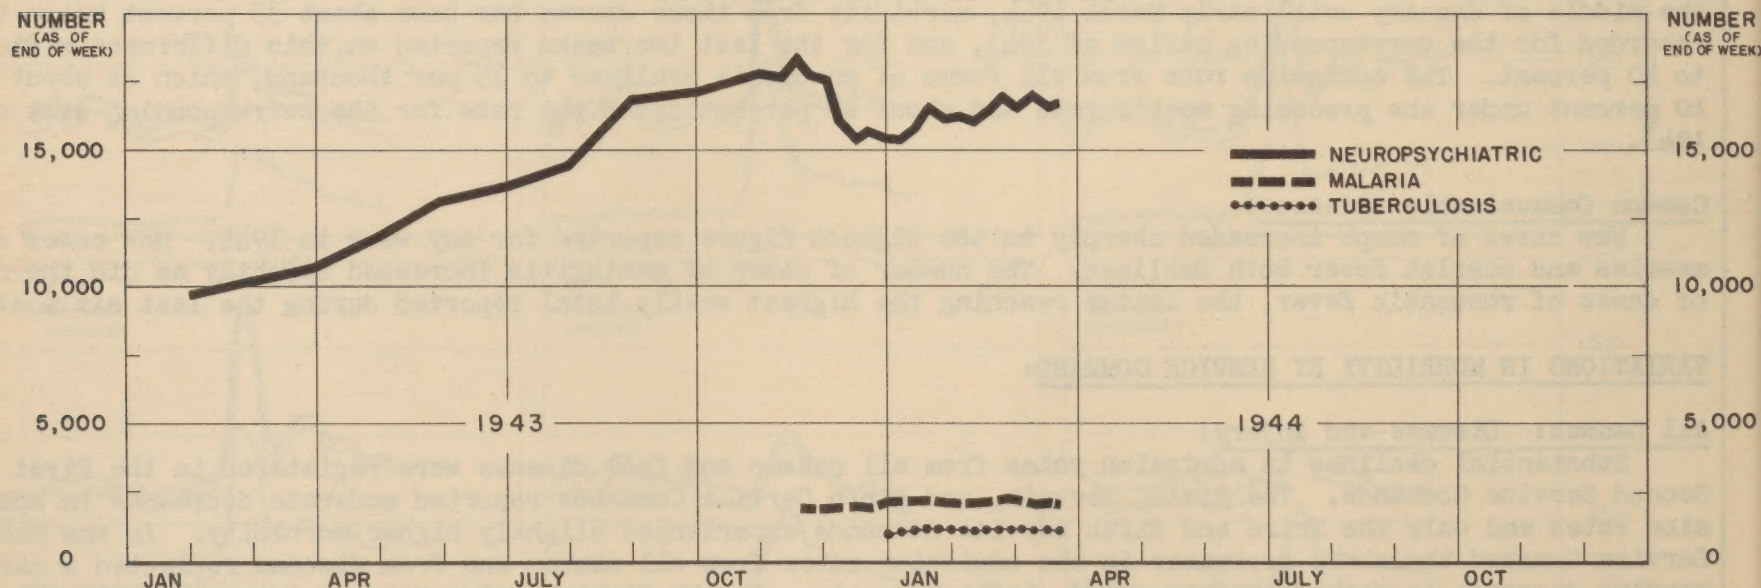

NON-EFFECTIVE RATE

CONTINENTAL UNITED STATES

PATIENTS REMAINING UNDER TREATMENT

CONTINENTAL UNITED STATES

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 24 MARCH 1944

COMMENT ON CURRENT TRENDS (CONT'D)

Sixth Service Command again reported the highest admission rate from all causes (898 per thousand) and from disease (842 per thousand). The First Service Command displaced the Eighth Service Command as the one with the lowest morbidity from all causes (590 per thousand) although the Eighth Service Command continued to have the lowest morbidity from disease (529 per thousand).

Respiratory Causes:

All Service Commands reported lower admission rates from colds, influenza, etc. By far the largest decrease occurred in the Second Service Command, but the Sixth, First and Third Service Commands also reported sizeable declines in morbidity from these causes. Nevertheless the Sixth Service Command continued to experience the highest morbidity from colds, influenza, etc. (350 per thousand), while the lowest admission rate (130 per thousand) was again reported by the Eighth Service Command. Declines in morbidity from pneumonia were reported from the Second and Third Service Commands, while the Sixth Service Command reported increased morbidity from this cause as well as the highest incidence in the country.

Common Communicable Diseases:

Sharp increases in morbidity from venereal diseases (excluding EPTS cases) were registered in the Third and Fifth Service Commands, while the Second Service Command which had reported the highest morbidity from these causes for the week ending 17 March 1944, showed a markedly lower admission rate. As a result the Fifth Service Command experienced the highest morbidity from venereal diseases (41 per thousand) during the week ending 24 March 1944. The largest increases in the number of new cases of mumps occurred in the Fourth and Seventh Service Commands, with the former accounting for nearly 30 percent of the total number of new cases of mumps in the country. New cases of measles dropped very sharply in the Seventh Service Command, but increased in the Fourth Service Command; the latter accounted for over 25 percent of the total number of the new cases of measles. The number of new cases of meningitis about doubled in the Fourth Service Command, with the result that this Service Command reported 40 percent of the new cases of meningitis in the country.

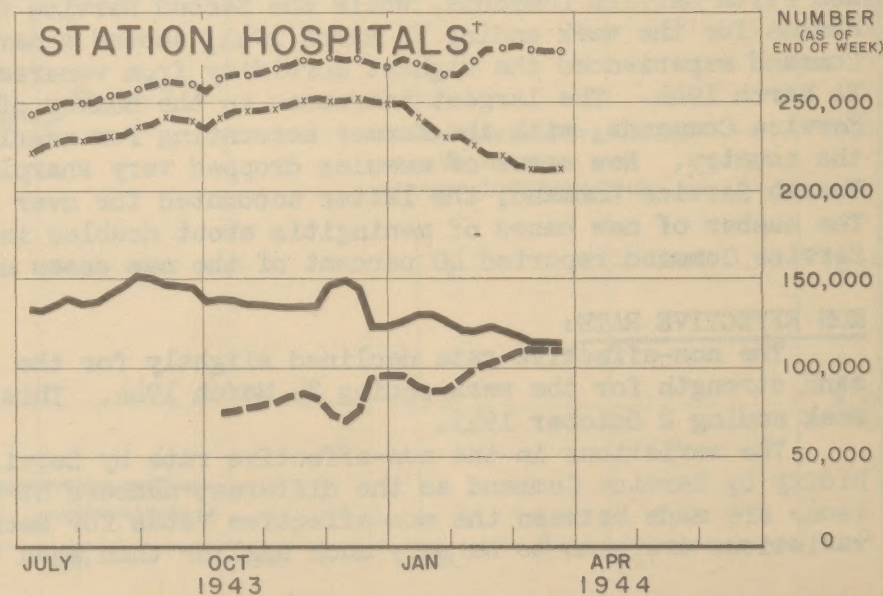

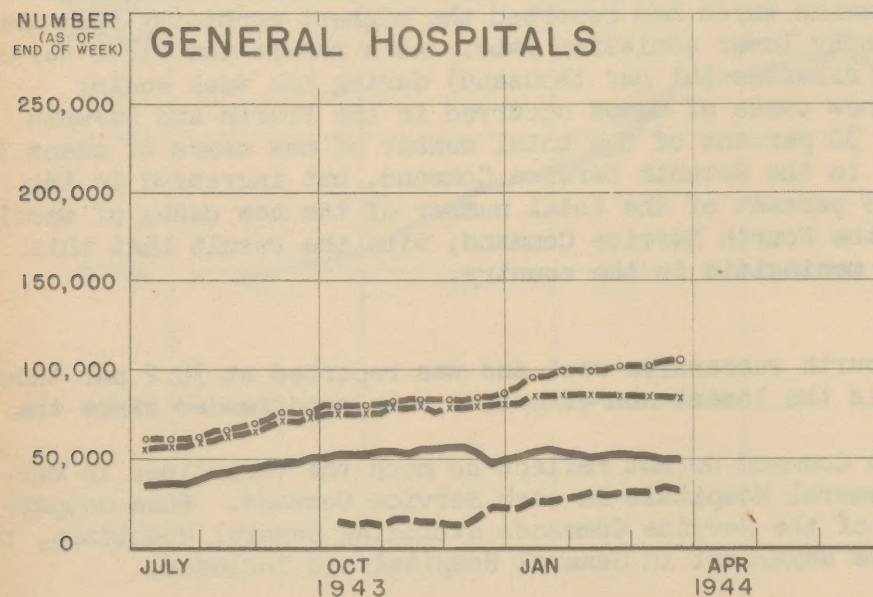

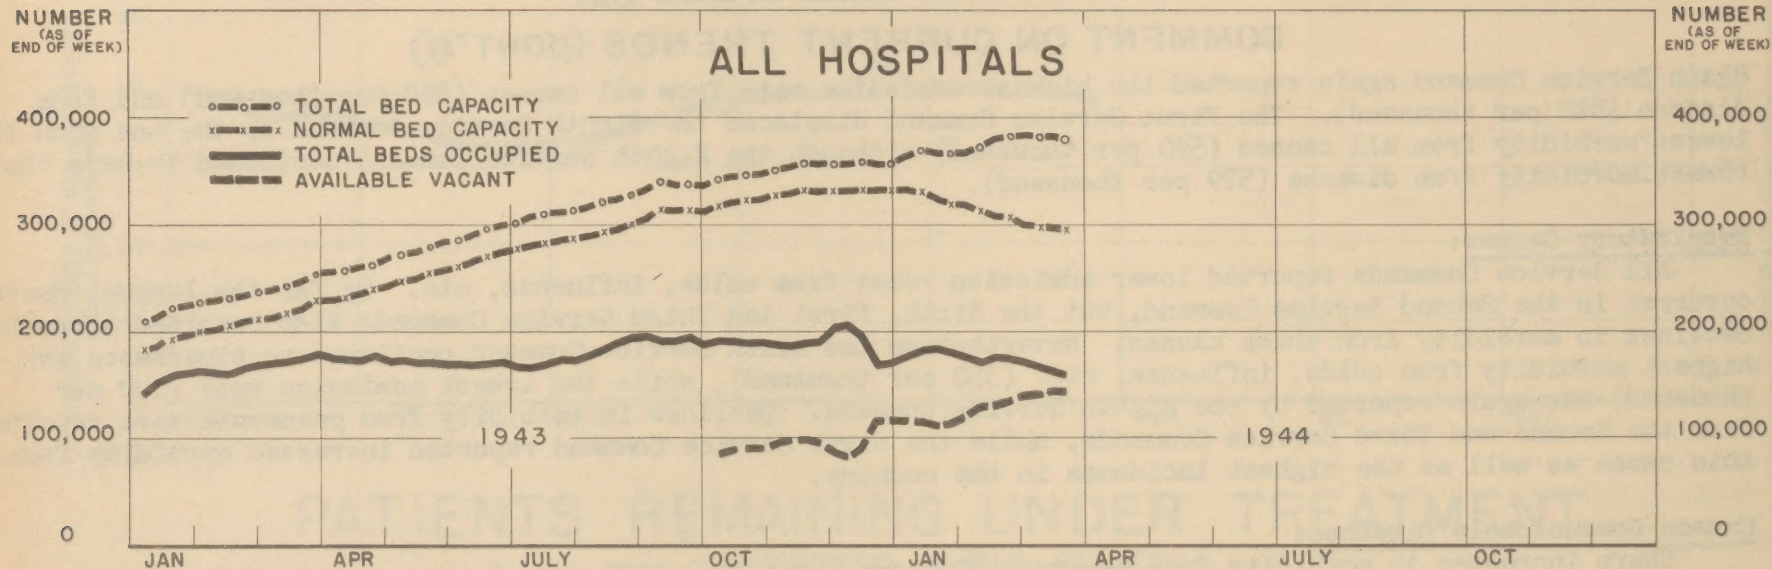

NON EFFECTIVE RATE:

The non-effective rate declined slightly for the fourth successive week and was reported at 38.2 per thousand strength for the week ending 24 March 1944. This is the lowest non-effective rate experienced since the week ending 2 October 1943.

The variations in the non-effective rate by Service Command do not reflect so much the variations in morbidity by Service Command as the different numbers of General Hospitals in each Service Command. When comparisons are made between the non-effective rates for each of the Service Commands excluding General Hospitals, the variations are seen to be very much smaller than when the days lost in General Hospitals are included.

HOSPITALIZATION DATA*

CONTINENTAL UNITED STATES

WEEKLY HEALTH REPORT

FOR THE WEEK ENDING 24 MARCH 1944

COMMENT ON CURRENT TRENDS (CONT'D)

PATIENTS REMAINING UNDER TREATMENT:

The total number of Army patients remaining in hospital at the end of the week decreased to about 37 per thousand strength.

Since the last week of January 1944 the number of neuropsychiatric cases remaining has fluctuated in the range from 16,000 to 17,000 and for the week ending 24 March 1944 was reported at 16,603. The number of malaria cases under treatment has declined in recent weeks from a high of 2230 on 25 February to 2003 on 24 March 1944; only 13 of the 2003 malaria cases presumably were acquired in the United States. The number of tuberculosis cases remaining under treatment was reported at 1102 as of 24 March 1944.

CURRENT HOSPITAL CONDITIONS:

The total bed capacity as of 24 March 1944 was reported at about 378,000 or 3000 less than at the end of the previous week. The number of beds occupied was nearly 160,000 or 2000 less than at the end of the previous week, while the number of "available vacant" beds remained almost stationary at 143,000. Total beds occupied represented 53 percent of total bed capacity. There were 11 stations with bed capacity of about 3,300 having no "available vacant" beds; no General Hospitals were included among them.

The number of normal beds reported remained stationary during the week and as of 24 March 1944 stood at about 297,000 or 78 percent of the total bed capacity. Included in the normal bed capacity on 24 March 1944 were 8,250 tentage and non-fixed hospital beds in maneuver areas, while the total bed capacity included 8,635 such beds.

The total bed capacity of General Hospitals, which has shown a steady increase in recent months, was reported at about 100,000 as of 24 March 1944. On the same date about 49,000 of these beds (or 49 percent) were occupied. The "available vacant" beds at General Hospitals numbered 31,000 as of 24 March 1944. Normal beds at General Hospitals have been maintained at a level of about 85,000 since the beginning of the year.

The total bed capacity of Station Hospitals (including the relatively small number of beds in maneuver areas mentioned above) has remained practically level since the beginning of the year at about 275,000 beds, while the normal beds in these hospitals declined sharply from 250,000 as of 7 January 1944 to 212,000 as of 24 March 1944. Total beds occupied as of 24 March 1944 numbered 110,000 or about 40 percent of the corresponding total bed capacity. Station Hospitals had 112,000 "available vacant" beds as of 24 March 1944, the highest number yet reported.

As of 24 March 1944 the bed capacity of convalescent facilities in General Hospitals numbered 9982 beds of which 4,088 beds, or 41 percent, were occupied.

SUPPLEMENTARY HEALTH REPORT

REVIEW OF MORBIDITY DATA FOR 1942 AND 1943

NATURE OF THE DATA

This Supplementary Health Report presents a review of the Army's morbidity and mortality experience in the continental United States during 1942 and 1943. The experience is shown for the country as a whole month by month and also for each Service Command in 1943. The data, like those of the Weekly Health Reports, have been taken from Forms 86ab rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

The figures here presented are the result of a comprehensive review and revision of the 1943 data; they include corrections which could not be incorporated in previously presented monthly summaries, compiled within three or four weeks after the receipt of the reports. The revised data for 1943 also include adjustment for unreported experience and other corrections. It was not practicable to review the 1942 data as thoroughly and the 1942 figures therefore should not be given as high credibility as those for 1943.

Charts showing morbidity trends from all causes, from all diseases combined, from injury and from colds, influenza, etc. are presented on page 38, while similar charts for particular diseases appear on pages 39 and 40. Mortality trends from all causes, from disease, and from injury are presented in a chart on page 41. Summaries showing the number of admissions and corresponding morbidity rates and the number of deaths and corresponding mortality rates for the United States as a whole

during 1942 and 1943 appear on pages 42 and 43, while on pages 44 to 54 are given corresponding data for the United States as a whole and for the Service Commands for 1943 only.

In the discussion and in the detail tables each of the four or five week periods based on the number of Fridays in a particular calendar month is referred to as a "month". While annual rates based on each such "month's" experience are entirely comparable, the absolute numbers of admissions (or deaths) for each such period are not; for this reason the symbol "≠" has been entered in the first column of the detail tables to indicate the months which cover 5 weeks. Where no cases at all were reported, a dash "-" has been entered; where 1 or more cases were reported, but the rate is less than .05 per thousand, this is indicated by showing the rate as .0. Where data for a particular category were not available, this is indicated by the symbol "#".

REVIEW OF 1942 AND 1943 EXPERIENCE

All Causes: Disease and Injury

The health of the Army in the continental United States continued satisfactory throughout 1942 and 1943. Admissions on account of disease and injury were reported at 819 per year per thousand strength in 1943 as compared with 760 per thousand strength in 1942. However, part of the excess admission rate in 1943 represented the deliberate policy (inaugurated late in 1942) of inducting into the Army men with venereal disease.

SUPPLEMENTARY HEALTH REPORT

REVIEW OF MORBIDITY DATA FOR 1942 AND 1943 (CONT'D)

It appears therefore that on a more comparable basis the 1943 morbidity of the Army in the United States was not materially higher than that experienced in 1942. This morbidity level is about half way between that reported for the years preceding the war in Europe and the high rate reached in 1941, as a result of the influenza epidemic in the first quarter of that year.

Respiratory Causes

Despite an outbreak of respiratory infections in December, the 1943 admission rate from colds, influenza, etc. was almost exactly the same as in 1942 or about 24⁵ per thousand. This rate is about 30 percent under that experienced in 1940 and 1941 but considerably above the level prevailing in the Army during non-epidemic years in peacetime.

The outbreak of respiratory infections in December 1943 was relatively mild as is evidenced by the fact that the admission rate from colds, influenza, etc. for the month was only about 10 percent higher than for December 1942 while the peak morbidity recorded for the country as a whole was less than half that registered in December 1941.

The reported rate of admission from all forms of pneumonia was somewhat higher in 1943 than in 1942. However since the disparity appears greatest during the early months of the year it may in part reflect the underreporting of pneumonia admissions before atypical pneumonia became reportable as a separate entity (March 1942). Atypical pneumonia has since accounted for an increasing proportion of total pneumonia admissions.

Common Communicable Diseases

Higher morbidity from diarrhea and dysentery in

1943 as compared with 1942 appears largely to have been due to a number of outbreaks in the Fourth and Fifth Service Commands.

The incidence of measles, mumps and scarlet fever was also higher in 1943 than in 1942. Morbidity from measles in 1943 was however only about half that experienced in 1941. Admission rates for mumps and scarlet fever in 1943 were not materially different from those in 1941.

Chiefly because of the induction into the Army in 1943 of increasingly large numbers of men with venereal diseases the admission rate from these causes rose from 39 per thousand in 1942 to 45 per thousand in 1943 - a new high for recent years. However, disregarding the cases which existed prior to induction or which were acquired on furlough before reporting for active duty, the morbidity from venereal diseases in 1943 was only 26 per thousand. This is believed to be lower than the rate experienced in peacetime years. A study is now in progress to develop a corresponding rate for 1942.

Other Communicable Diseases

Admissions from meningitis which in recent years had been on a low level began to increase in December 1942 and reached epidemic proportions by March 1943. As a result of various measures which were promptly taken to control the situation, the admission rate soon fell to its former low level.

A sharp increase in admissions from rheumatic fever was also recorded during the first six months of 1943, concentrated chiefly in the Seventh Service Command. Because of the fact that Forms 86ab did not provide a printed entry for rheumatic fever in

SUPPLEMENTARY HEALTH REPORT

REVIEW OF MORBIDITY DATA FOR 1942 AND 1943 (CONT'D)

1942 and for other reasons, there was considerable understatement in the number of rheumatic fever admissions during 1942. This situation held true in all Service Commands except the Second.

Morbidity from tuberculosis which showed a steady decline throughout 1942 continued to decrease during 1943. The admission rate for 1943 was only about 75 percent of that recorded for 1942.

In July 1943 a directive was issued requiring that malaria cases in the United States be classified according to their presumptive origin in or out of the United States. Based on a study of the reports since September 1943, an estimate was made of the admissions from malaria acquired in the United States during 1943. The incidence of malaria acquired in the United States is seen to be very low, with a peak during the summer months. The increasing number of total malaria cases reported reflects the return to the United States of large numbers of individuals who contracted malaria overseas.

Injuries

As a result of special efforts to reduce accidents (by education, training, and use of safe-guards) the rate of admission from injury which had shown a sharp decrease in 1942 from the high level prevailing in 1941 registered a further decrease in 1943. The 1943 injury admission rate of 80 per thousand appears to be under the lowest rate from this cause reported in recent years.

Neuropsychiatric Disorders

Admissions for neuropsychiatric disorders were first required to be reported on the present basis

in the latter part of 1942. Because there was no printed entry therefor on Form 86ab, neuropsychiatric admissions were for a considerable time incorrectly reported. A study was made of the December 1943 reports to estimate the actual neuropsychiatric admissions (see Supplemental Health Report included with the Weekly Health Report for the week ending 21 January 1944). The revised data indicate that there was a marked increase in admissions from neuropsychiatric causes during the first nine months of 1943. Because of intensive efforts to detect such disorders and for other reasons (among them the re-considering of the medical fitness of limited service men) the admission rate from neuropsychiatric causes rose from about 20 per thousand in the latter part of 1942 to about 35 per thousand in August and September 1943 but declined during the last three months to average 27 per thousand for the year 1943.

The number of neuropsychiatric cases remaining under treatment rose from about 8,200 at the end of 1942 to a peak of almost 18,000 in the latter part of 1943 and then declined to about 15,000 at the end of the year. Almost all of this change was attributable to open ward cases; locked ward cases varied only within the range of 4,100 to 5,100 during 1943.

There has been some tendency to overstate the number of admissions to open wards and to correspondingly understate the admissions to locked wards; it has not been practicable to make corrections for this in the data here presented.

SUPPLEMENTARY HEALTH REPORT

REVIEW OF MORBIDITY DATA FOR 1942 AND 1943 (CONT'D)

Mortality

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 25 percent and occasionally even more, but the death rate from disease is not materially understated.

Readers are cautioned not to use the death rates from injury or the death rates from all causes shown in this report as accurate indications of mortality rates.

It may also be noted that for some months the number of deaths from all causes as shown in this report exceeds the total of the disease deaths and injury deaths. The reason for this is that occasionally a few battle casualty deaths among evacuees (originally classified as "battle casualty") have been properly included with the total deaths.

During 1942 the mortality rate from disease was recorded as .64 per thousand, while the death rate from injury was reported at 1.39 per thousand and is estimated to have been in the neighborhood of 1.75 per thousand, resulting in an estimated death rate from all causes of about 2.4 per thousand. During 1943 the death rate from disease was reported at .58 per thousand and the death rate from injury at 1.63 per thousand. After adjustment for under-reporting, the 1943 death rate from injury is estimated at about 2.0 per thousand resulting in a mortality rate from all causes of about 2.6 per thousand.

Non-effective Rate

Data on the non-effective rate have been presented only for the United States as a whole, because the variations in the non-effective rate by Service Command do not reflect so much any differences in morbidity between Service Commands, as the varying number of hospitals in each Service Command.

The revised data indicate that the non-effective rate for the country as a whole rose from 31.7 per thousand strength during 1942 to 36.5 per thousand during 1943. This increase in the non-effective rate reflects in addition to the slightly higher admission rate experienced in 1943 such factors as the hospitalization of an increasing number of evacuees from overseas theaters and the natural increase in non-effectiveness to be expected in a group, which after a period of rapid expansion, is levelling off in numbers; as a result, cases of long duration tend to accumulate and comprise a higher proportion of total cases under treatment than in the past.

SUPPLEMENTARY HEALTH REPORT

REVIEW OF MORBIDITY DATA FOR 1942 AND 1943 (CONT'D)

VARIATIONS BY SERVICE COMMAND IN 1943All Causes: Disease and Injury

The Seventh Service Command reported the highest admission rates from all causes and from all diseases combined in 1943, both rates being about 20 percent above the average for the United States. On the other hand, the First Service Command and the Military District of Washington had the lowest morbidity from all causes and from disease, specifically about 15 percent below the average for the country as a whole.

With the exception of the Military District of Washington, which reported an extremely low admission rate from injury, morbidity from this cause did not vary widely by Service Command. Disregarding the Military District of Washington, the admission rate from injury ranged from a low of 65 per thousand for the First Service Command to a high of about 85 per thousand for the Fourth, Eighth, and Ninth Service Commands.

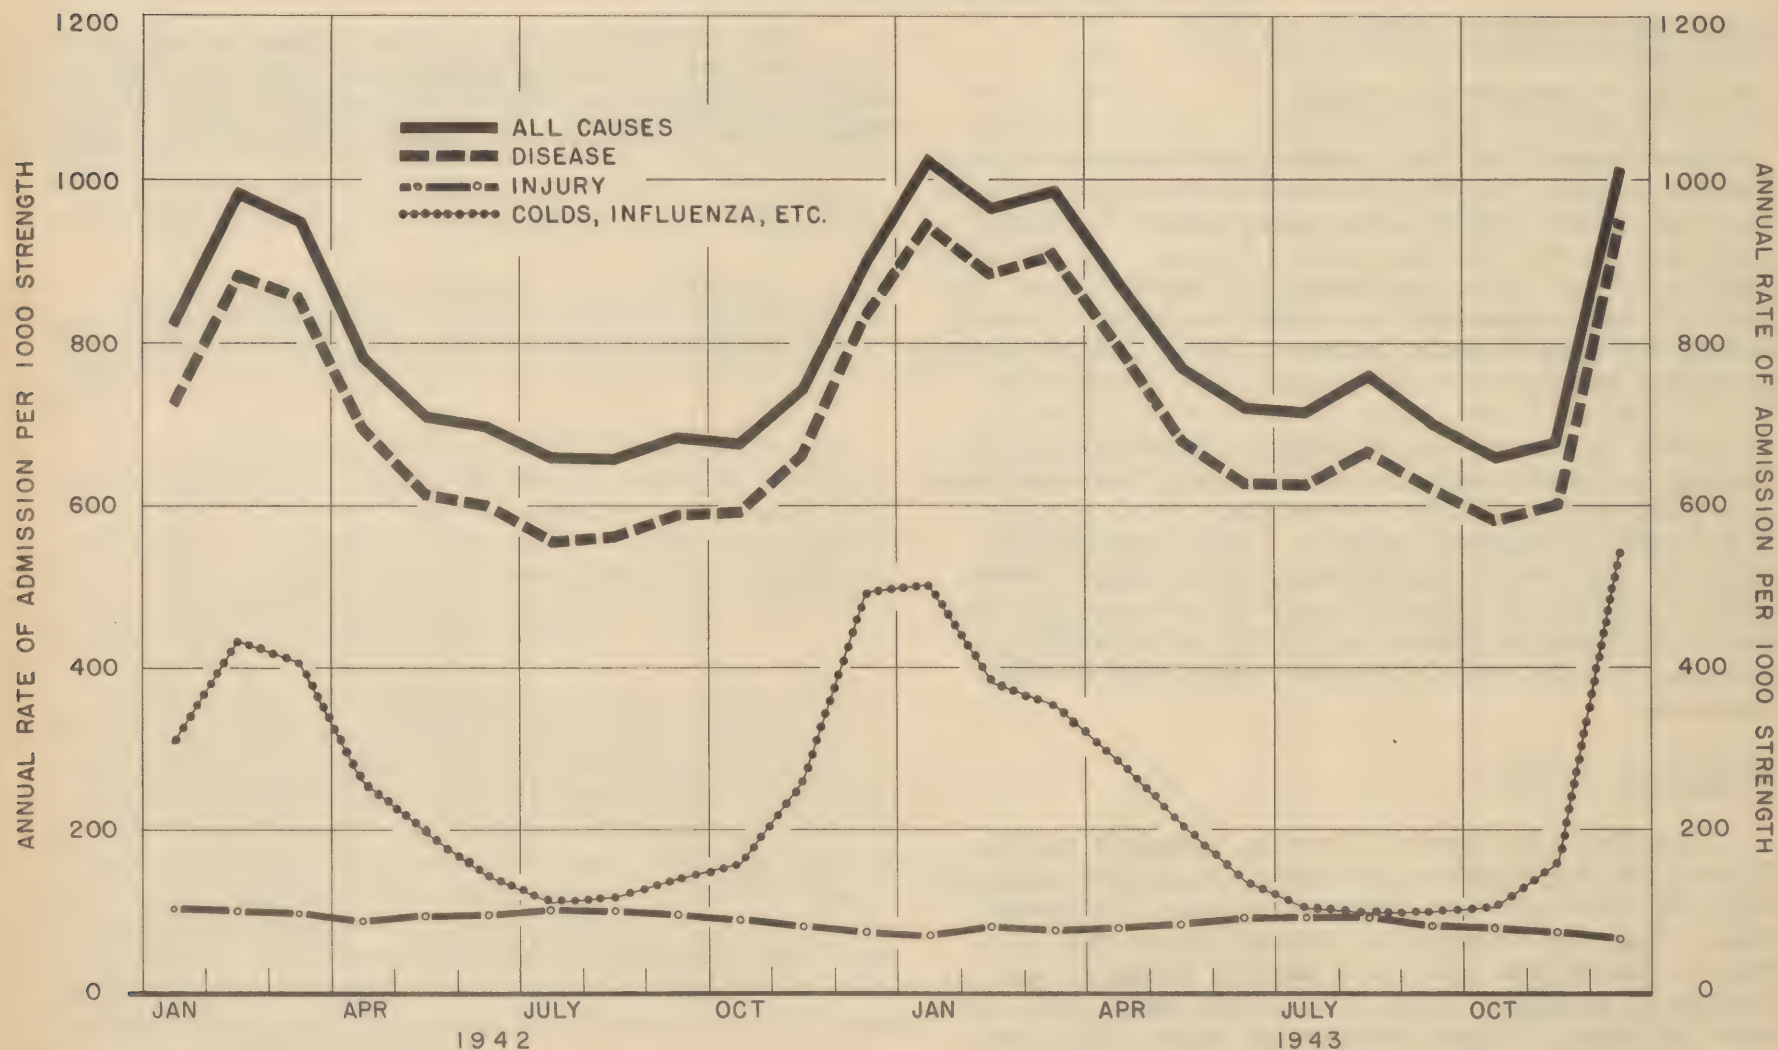

Respiratory Causes

The Sixth and Seventh Service Commands had the highest admission rates for colds, influenza, etc. in 1943, at about 370 per thousand or about 50 percent higher than the average for the United States as a whole. The Eighth and Ninth Service Commands had the lowest morbidity from colds, influenza, etc. with rates of about 210 per thousand or about 15 percent lower than the United States average.

The highest morbidity from pneumonia was recorded in the Seventh Service Command and the Military District of Washington (about 29 per thousand), while the lowest was in the Ninth Service Command (about 11 per thousand).
